

IQS397 Datasheet

An Inductive/Capacitive ProxFusion® sensing device with an integrated haptics driver. The haptics LRA driver features internal H-bridge and H-bridge protection. Standalone operation offers efficient integration without the need for a master device. An optional I²C mode allows the configuration of multiple haptics settings including autoresonance.

1 Device Overview

The IQS397 is a ProxFusion® sensing device with an integrated haptics driver capable of driving Linear Resonant Actuator (LRA) motors. A ProxFusion channel event will trigger the haptic driver to allow effective feedback to the user. Standalone operation allows basic configuration via external strap options. The device also offers an I²C mode featuring configurable composite waveforms. The I²C mode features a closed-loop autoresonance algorithm. The autoresonance algorithm matches the resonant frequency of the driven motor in real time. Power consumption is optimised by automatic power mode management and an ultra-low power mode.

1.1 Main Features

- > Standalone Mode
 - Sensor event triggers haptic feedback
 - Strap options allow for:
 - * Sensitivity adjustment
 - * Report rate adjustment
 - Digital output (active low, push-pull)
- > I²C Mode
 - I²C interface - Up to Fast Mode Plus (1 MHz)
 - Convert to a standalone mode after power-on configuration
 - Fire-and-forget interface
 - Trigger haptic via sensor event or I²C command
 - Real-time closed loop autoresonance
 - Internal or external H-bridge
 - Selectable LRA drive frequency
- > Internal H-bridge protections
- > Ultra low power mode
- > Automatic power mode management
- > Design simplicity
 - PC software for configuration and debugging
- > Supply Voltage: 1.71 V to 3.6 V
- > QFN20 Package (3 × 3 × 0.55 mm) - 0.4 mm pitch

QFN20 Package

1.2 Applications

- > User interface touch buttons
- > Doorbells and keypads

1.3 Block Diagram

2 Usage Disclaimer

NOTWITHSTANDING ANYTHING TO THE CONTRARY IN THIS DOCUMENT OR IN ANY OTHER AGREEMENT, CUSTOMER ACKNOWLEDGES THAT THE PRODUCTS ARE PROVIDED WITHOUT ANY WARRANTY OF NON-INFRINGEMENT, AND THAT IF ANY LICENSE OR RIGHT IS REQUIRED TO BE OBTAINED FROM ANY THIRD PARTY, THIS RESPONSIBILITY SHALL REST SOLELY WITH CUSTOMER.

2.1 Order Code Description

2.1.1 IQS397-0xx

The IQS397-0xx is a single channel I²C application with an integrated haptics driver capable of driving Linear Resonant Actuator (LRA) motors. The IQS397-0xx can be switched to a standalone operating mode.

Applications of the IQS397-0xx order codes include general-use inductive buttons and Doorbells (touch and release detection).

2.1.2 IQS397-1xx

The IQS397-1xx is a single channel standalone inductive button application with an integrated haptics driver capable of driving Linear Resonant Actuator (LRA) motors. The IQS397-1xx can be switched to a I²C operating mode for debugging.

Applications of the IQS397-1xx order codes include general-use inductive buttons and Doorbells (touch and release detection).

2.1.3 IQS397-2xx

The IQS397-2xx is a single channel standalone capacitive button application with an integrated noise filtering algorithm. The IQS397-2xx can be switched to a I²C operating mode for debugging.

Applications of the IQS397-2xx order codes include user interface touch buttons and keypads.

4 Electrical Specifications

4.1 Absolute Maximum Ratings

Table 4.1: Absolute Maximum Ratings

Symbol	Rating	Min	Max	Unit
V _{DD}	Voltage applied at VDD pin (referenced to VSS)	−0.3	3.6	V
V _{IN}	Voltage applied to any ProxFusion® pin (referenced to VSS)	−0.3	V _{REG}	V
	Voltage applied to any other pin (referenced to VSS)	−0.3	V _{DD} + 0.3 (3.6 V max)	V
T _{stg}	Storage temperature	−40	85	°C

4.2 General Operating Conditions

Table 4.2: General Operating Conditions

Symbol	Parameter	Typ	Unit
F _{CLK}	Master clock frequency	14	MHz
F _{PROX}	ProxFusion® engine clock frequency	14	MHz
V _{REG}	Internally-regulated supply output	1.53	V

4.3 Recommended Operating Conditions

Table 4.3: Recommended Operating Conditions

Symbol	Parameter	Min	Recommended	Max	Unit
V _{DD}	Standard operating voltage, applied at VDD pin	1.71		3.6	V
T _A	Operating free-air temperature	−20		85	°C
C _{VDD}	Recommended capacitor at VDD	C _{VREG}	2 × C _{VREG}		μF
C _{VREG}	Recommended external buffer capacitor at VREG (ESR ≤ 200 mΩ)	2.2 ⁱ	4.7	10	μF

ⁱ Absolute minimum allowed capacitance value is 1 μF, after taking derating, temperature, and worst-case tolerance into account. Please refer to [AZD004](#) for more information regarding capacitor derating.

4.4 ProxFusion® Electrical Characteristics

Table 4.4: Recommended Operating Conditions for ProxFusion® Pins

Symbol	Parameter	Min	Max	Unit
$C_{XSELF-VSS}$	Capacitance between ground and external electrodes, in self-capacitance mode	1	400 ⁱ	pF
$R_{Cx(SELF)}$	Series in-line resistance of self-capacitance electrodes	0	1 ⁱⁱ	kΩ

ⁱ $R_{Cx} = 0\Omega$

ⁱⁱ Series resistance limit is a function of F_{xfer} and the circuit time constant, RC . $R_{max} \times C_{max} = 1/(10 \times F_{xfer})$, where C is the pin capacitance to VSS.

4.5 ESD Rating

Table 4.5: ESD Rating

			Value	Unit
$V_{(ESD)}$	Electrostatic discharge voltage	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁱ	±2000	V

ⁱ JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±2000 V may actually have higher performance.

4.6 Reset Levels

Table 4.6: Reset Levels

Parameter		Min	Max	Unit
V_{DD}	Power-up (Reset trigger) – slope > 100 V/s	1.65		V
	Power-down (Reset trigger) – slope < -100 V/s		0.9	

4.7 MCLR Pin Levels and Characteristics

Table 4.7: MCLR Pin Characteristics

Parameter		Min	Typ	Max	Unit
V_{IL}	MCLR input low level voltage	$V_{SS} - 0.3$		$0.25 \times V_{DD}$	V
V_{IH}	MCLR input high level voltage	$0.75 \times V_{DD}$		$V_{DD} + 0.3$	V
R_{PU}	MCLR pull-up equivalent resistor		210		kΩ
t_{Trig}	MCLR input pulse width – ensure trigger	250			ns

Figure 4.1: MCLR Pin Diagram

4.8 Digital I/O Characteristics

Table 4.8: Digital I/O Characteristics

Parameter		Test Conditions	Min	Max	Unit
V _{OL}	SDA & SCL output low voltage	I _{sink} = 20 mA		0.3	V
	GPIO output low voltage	I _{sink} = 10 mA		0.15	V
V _{OH}	Output high voltage	I _{source} = 20 mA	V _{DD} - 0.2		V
V _{IL}	Input low voltage		V _{SS} - 0.3	0.3 × V _{DD}	V
V _{IH}	Input high voltage		0.7 × V _{DD}	V _{DD} + 0.3	V
I _{GPIO}	Output current sunk by any GPIO pin			10	mA
	Output current sourced by any GPIO pin			20	
C _b	SDA & SCL bus capacitance			550	pF

4.9 I²C Characteristics

Table 4.9: I²C Characteristics

Parameter		Min	Max	Unit
f _{SCL}	SCL clock frequency		1000	kHz
t _{HD,STA}	Hold time (repeated) START condition	0.26		μs
t _{LOW}	LOW period of the SCL clock	0.5		μs
t _{HIGH}	HIGH period of the SCL clock	0.26		μs
t _{SU,STA}	Set-up time for a repeated START condition	0.26		μs
t _{HD,DAT}	Data hold time	0		ns
t _{SU,DAT}	Data set-up time	50		ns
t _{SU,STO}	Set-up time for STOP condition	0.26		μs
t _{BUF}	Bus free time between a STOP and START condition	0.5		μs
t _{SP}	Pulse duration of spikes suppressed by input filter	0	50	ns

4.10 H-Bridge Specifications

Table 4.10: H-Bridge Specifications

Symbol	Parameter	Min	Nominal	Max	Unit
R _L	Load resistance at V _{DD} = 3.3 V		18		Ω
I _L	Load current		150	200	mA
F _{LRA}	LRA drive frequency	100		300	Hz

4.11 Current Consumption

The current consumption of the IQS397 is highly dependent on the specific parameters configured during initialisation, as well as on the frequency and duration of I²C communications. Therefore, the following tables serve as an illustration of the expected power consumption for similar configurationsⁱ. All measurements are taken with either *Event Mode* or *Standalone Mode* enabled, without any sensor activations, and without any I²C communications. Momentary higher current consumption may be expected during activated states. The setup for the current measurement is shown in Table 4.11 and all other settings, unless stated otherwise, are kept default.

Table 4.11: IQS397 Inductive and Self-capacitive Current Measurement Setup

Parameters	Inductive	Self-capacitive
Number of Channels	Single I²C / Standalone channel	
ATI Target	4000	5000
ATI Base	4000	10000
HFosc	14 MHz	
Tx at HFosc	Enabled	Disabled
Invert Logic	Enabled	Disabled
Charge transfer frequency	1.75MHz	875kHz
Interface Selection	Event Mode / Standalone	

ⁱ These measurements are based on bench testing and have not been characterised over large volumes.

Table 4.12: IQS397 Inductive (I^2C Event Mode)

Configuration	Sampling period [ms]	Sensing Mode	Typical Current [μA] 3.3V	
			NP	ULP
InputB to VSS	200	Inductive	8	4
InputB to VDD	43		26	6

Table 4.13: IQS397 Inductive (Standalone Mode)

Configuration	Sampling period [ms]	Sensing Mode	Typical Current [μA] 3.3V	
			NP	ULP
InputB to VSS	200	Inductive	8	4
InputB to VDD	43		26	6

Table 4.14: IQS397 Self-Capacitive (I^2C Event Mode)

Configuration	Sampling period [ms]	Sensing Mode	Typical Current [μA] 3.3V

			NP	ULP
InputB to VSS	200	Self-capacitive	12	4
InputB to VDD	43		43	11

5 LRA Drive Theory

A Linear Resonant Actuator (LRA) is a spring mass system. The mass is magnetic. A driving coil creates a magnetic field to exert force on the magnetic mass.

The coil must be driven with an Alternating Current (AC) voltage to create the magnetic field. When the frequency of this AC voltage matches the resonant frequency of the spring mass system, the maximum vibration force is exerted.

In the ideal case, the AC voltage is a pure sinusoid. The IQS397 approximates a pure sinusoid drive with a Pulse Width Modulated (PWM) drive signal. When the duty cycle of the PWM drive is varied sinusoidally, the average drive voltage follows a pure sinusoid.

Figure 5.1: PWM Drive Approximation

Figure 5.1 shows the PWM output drive in relation to the ideal sinusoid drive. T_h is the width of a single half cycle. For a 200 Hz motor, this would be $\frac{1}{2 \times 200} = 2.5$ ms. The motor is driven in the forward direction for one half cycle and then in the reverse direction for one half cycle. This is repeated for the duration of the haptic pulse. The strength of vibration depends on the amplitude of the average sinusoidal drive. Since the amplitude of the average drive signal is directly related to the maximum duty cycle of the PWM drive, the vibration strength can be varied by changing the maximum duty cycle of the PWM drive signal.

It is difficult to vary the duty cycle of the PWM according to a pure sinusoid. For this reason, the IQS397 applies a further approximation to the PWM drive signal. Each half cycle of the sinusoidal modulation is approximated as three linearly interpolated segments. The first segment is linearly increasing, the second constant, and the third linearly decreasing. The IQS397 provides fine control over these segments. A detailed description of the configuration of these segments is given in Section 9.

6 Autoresonance

6.1 Operation

The autoresonance algorithm matches the drive frequency to the resonant frequency of the driven LRA. The driver operates by monitoring the back-EMF of the motor at the end of every half cycle. By detecting the zero-cross of the back-EMF, the driver is able to track changes in the resonant frequency of the LRA. This provides consistent vibration strength in changing conditions and across production variations. It is recommended to set the initial frequency slightly higher than the expected resonant frequency.

6.2 Backoff

Once a frequency lock has been achieved, it is crucial that the zero-cross occurs. If the zero-cross does not occur, the driver has no information about the back-EMF and cannot make an intelligent decision about the next half cycle's drive frequency. A zero-cross may not occur when the drive frequency is far from the resonant frequency of the motor. If the drive frequency is much lower than the resonant frequency, it can take many cycles to acquire a lock. If the drive frequency is much higher than the resonant frequency, an accurate lock may never be achieved.

When a zero-cross does not occur, the driver assumes that the drive frequency is too low. The driver increases the drive frequency by a fixed percentage. This is an attempt to re-establish a frequency lock. In most cases, a zero-cross will be seen within the next few half cycles, and the frequency lock will be restored.

This effect can be mitigated by slightly increasing the drive frequency such that it is more than the exact resonant frequency as measured by the zero cross. Unless conditions change significantly, this guarantees that a zero-cross will occur on the next half cycle.

The drive frequency should be increased by as little as possible to ensure it matches the resonant frequency. The exact amount depends on the motor being driven. To this end, the [Autoresonance Backoff](#) setting is included in the memory map.

When a zero-cross is detected, the drive frequency will be set to the resonant frequency of the motor and then increased by a percentage equal to one hundred divided by the value in the *Autoresonance Backoff* register.

$$\text{Percentage Increase} = \frac{100}{\text{Autoresonance Backoff}}$$

Setting *Autoresonance Backoff* to '0' will match the zero-cross frequency exactly.

In Figure 6.1, the current half-cycle drive is shown in red. Provided $T_{h(n)}$ is close to but less than the resonant half-cycle period, the back-EMF of the motor will lag the drive voltage. The driver detects the zero cross of the back-EMF and uses this to determine T_z . The frequency of the next half cycle is then increased from T_z in accordance with the *Autoresonance Backoff* setting to determine $T_{h(n+1)}$. This is the period of the next half cycle. Note that Figure 6.1 shows the average voltage for the driven half cycles and the instantaneous voltage for the back-EMF.

Figure 6.1: Autoresonance Backoff

6.3 Recommend Recalibrate

If the frequency at the start of a waveform differs by more than 25% from the frequency at the end of the waveform, the *Recommend Recalibrate* bit in register 0x1003 will be set. Typically, this will occur for one of three situations:

1. This is the first haptic pulse, and the starting frequency was far from the resonant frequency.
2. External conditions have changed significantly.
3. An error has occurred with the autoresonance algorithm.

The *Recommend Recalibrate* bit is cleared when the master adjust the LRA frequency by writing to the *LRA Frequency* register over I²C.

For item 1, the master can simply read the *LRA Frequency* register and write the same value back. This is most likely to occur during a calibration sequence, where the master initiates several autoresonance-enabled waveforms to find the motor frequency. The calibration sequence is successful when the *Recommend Recalibrate* bit is not set for several consecutive trigger haptic commands.

Items 2 and 3 are error conditions. If the *Recommend Recalibrate* bit is set outside of a calibration sequence, it indicates that either item 1 or item 2 has occurred. The calibration sequence should be done again.

7 H-Bridge

7.1 Settings

7.1.1 Slew Rate

The internal H-bridge has a slew rate-limiting function. This limits the slew rate of the PWM drive. Limiting the slew rate can help to reduce electromagnetic interference caused by the fast switching H-bridge drive signals.

The *Slew Rate Control* bit in the [H-Bridge Setup](#) register enables the slew rate function. When enabled, the *Slew Rate* setting selects the slew rate limit.

7.1.2 Drive Strength

The internal H-bridge is comprised of several drive stages. The *Drive Strength* setting in the [H-Bridge Setup](#) register controls which of these stages are active. The higher the *Drive Strength*, the more stages are active. The values in Section 4.10 are specified for a drive strength of '5'.

A drive strength of at least '1' is required for the H-bridge to function. Generally, the *Drive Strength* should be set to '5'.

Note: Over-current protection is disabled when the drive strength is set to '1' or '3'.

7.1.3 Ground Inactive

When the *Ground Inactive* bit in the [H-Bridge Setup](#) register is set, both M+ and M- will be pulled to ground when the motor is not being driven and the IQS397 is not in the ULP power state. In combination with inverted patterns, this can help to brake the motor and provide a crisper feel to the haptic pulse.

7.2 Protections

The internal H-bridge is equipped with several protection mechanisms. These are controlled by the H-bridge hardware. If enabled, they will automatically disable the H-bridge drive under the relevant error condition.

7.2.1 Over-current Protection

Over-current protection is enabled by setting the *Over-current Protection* bit in the [H-Bridge Setup](#) register. Over-current protection activates when the current drawn by the load connected to M+ and M- exceeds approximately 200 mA.

Note: The over-current protection can incorrectly trip when the pulse width of the PWM drive signal is small. This behaviour is dependent on the motor being driven. For this reason, over-current protection is disabled by default. The reliability of the over-current protection functionality should be assessed at design time.

7.2.2 Over-Temperature Protection

Over-temperature protection is enabled by setting the *Over-Temperature Protection* bit in the [H-Bridge Setup](#) register. Over-temperature protection activates when the temperature of the device exceeds the temperature specified by the *Over-Temperature Threshold* in the [Over-Temperature Settings](#) register.

The *Hysteresis* bit enables one-way hysteresis for over-temperature detection. This ensures that the over-temperature protection activates cleanly when an over-temperature condition occurs. It is recommended to always have hysteresis enabled when using the over-temperature protection functionality.

7.2.3 Shoot-Through Protection

Shoot-through protection is enabled by setting the *Shoot-through Protection* bit in the [H-Bridge Setup](#) register. Shoot-through protection prevents direct shorting of VDD to GND when the H-bridge transistors are switching. It is recommended to always have shoot-through protection enabled.

8 Haptic Control and Monitoring

8.1 Trigger Haptics Command

The currently configured waveform is played when a trigger haptics command is given. A trigger haptics command can be given through I²C or by using input pin control.

A trigger haptics command issued while haptics is active will be ignored.

Note: If the "Trigger haptics" command is issued while the device is in ULP mode, the haptic output will be queued and only execute when the device has finished its full sequence of ULP auto conversions at the instant of doing a "Normal power" loop again.

8.2 I²C Control

In I²C, a trigger haptics command is given by setting the *Trigger Haptics* bit in the [Haptic Control](#) register. The *Trigger Haptics* bit is cleared at the start of every waveform, regardless of how the waveform was triggered.

Since the *Waveform Selection* field and the *Trigger Haptics* bit are in the same register, only the address bytes plus a single data byte need to be written to both play and select a waveform.

The waveform can be stopped at any time by asserting the *Cancel Haptics* bit in the [Haptic Control](#) register. The waveform will be halted immediately, and the *Stop Haptics* bit will be cleared. If the *Cancel Haptics* bit is set when the haptics is not running, it will have no effect and will immediately be cleared.

8.3 LRA Drive Frequency

The [LRA Frequency](#) register is used to set the frequency in Hertz (Hz) at which the duty cycle of the PWM output drive changes. It is also used to report the frequency measured by the autoresonance algorithm.

8.4 PWM Frequency

The [PWM Frequency](#) register sets the frequency in Hertz (Hz) of the output PWM drive. Internally, this has an effect on the time domain resolution with which the duty cycle of the drive updates.

It is recommended to always set the *PWM Frequency* register to '20000'.

9 Haptic Effect Configuration

The IQS397 defines the following concepts:

Segment	A PWM pulse with a duty cycle that is either increasing, decreasing or constant.
Pattern	A series of up to three consecutive segments.
LRA Drive Period	The time it takes for one full LRA drive cycle.
Half Cycle	A pattern lasting one half of an LRA drive period.
Stage	A pattern played for a number of half cycles, where the drive direction alternates every half cycle.
Haptic Pulse	Up to five stages, played sequentially.
Waveform	Any number of haptic pulses.
Repeat Count	The number of haptic pulses per waveform.
Repeat Time	The time between haptic pulses.

Figure 9.1 shows the basic components of a single drive cycle. The segments are denoted S_0 , S_1 , and S_2 and make up an approximately sinusoidal pattern. Each half cycle, denoted H_0 and H_1 , consists of a single pattern. Every two-half cycles makes one LRA drive period. Every alternate half cycle is driven in the opposite direction to its predecessor.

Figure 9.1: Anatomy of One Full Drive Cycle

10 ProxFusion® Channel

The IQS397 features a ProxFusion® sensing channel that uses Azoteq's patented on-chip ProxFusion® module to measure and process relative changes in either capacitive or inductive sensors.

10.1 Sensing Modes

The ProxFusion® channel supports one of the following sensing modes:

- > Self-capacitive sensing
- > Resonated inductive sensing

The sensing mode can be modified in the [ProxFusion Settings 1](#) registers.

Please refer to the following [application notes](#) for more information:

- > AZD004: Overview of Azoteq's ProxFusion® Sensing
- > AZD115: Design Guidelines for Inductive Sensing
- > AZD125: Design Guidelines for Capacitive Touch Sensing

10.2 Counts

The ProxFusion® module reports a capacitance or inductance measurement as a relative, unit-less value referred to as "Raw Counts". These raw counts are related to the number of charge transfer cycles necessary to charge an internal sampling capacitor, and are typically inversely proportional to the signal measured on the external sensor.

10.2.1 Counts Linearisation

The IQS397 does not directly use the "Raw Counts" obtained from the sensing module, but uses "Linearised Counts", which is calculated as

$$\text{Linearised Counts} = \frac{3276750}{\text{Raw Counts}}. \quad (1)$$

All references to "Counts" in this datasheet, and in the I²C memory map, use these Linearised Counts values.

After linearisation, counts are filtered using a low-pass IIR filter to reduce the high-frequency noise in the measurement. The response of the filter can be adjusted with the *Counts Filter Beta* value in the [Filter Betas](#) registers. Higher beta values result in a slower filter response, with less noise on the channel.

10.3 Button Event Detection

Button Events attempt to emulate the behaviour of a typical button, which stays in activation for a configurable period of time as it is pressed. A *Button Proximity Event* occurs when the configurable [Proximity Threshold](#) has been reached and this happens when a target comes into close proximity with the sensing electrode. A *Button Touch Event* occurs when the configurable [Touch Threshold](#) has been reached.

10.3.1 Long-Term Average

Button events are detected by comparing the filtered counts value to a reference value, known as the Long-Term Average (LTA). While the channel is not in activation, the LTA is slowly updated to track changes in the environment using a low-pass filter.

The difference between the filtered counts and the LTA is stored as the *Delta* value.

$$\text{Delta} = \text{LTA} - \text{Counts} \quad (2)$$

The delta is used to detect user interaction by comparing it to the *Touch Threshold*. The channel enters the active state when the delta exceeds the threshold, and the *Touch Active* bit in the *Button Events* register will be set.

Figure 10.1: Button UI Activation

The LTA is then halted (kept constant) while the Button event is active, or while the delta exceeds the *LTA Halt Threshold*, as shown in Figure 10.1. The LTA Halt Threshold can typically be made smaller than the Button Threshold. This may help increase the sensitivity of the event detection during slower activations, preventing the LTA from drifting during user interaction.

The response of the LTA filter is controlled by the various *LTA Beta* values. The *LTA Beta* value sets the response of the filter during High-Accuracy and Normal power modes, whereas the *Low Power LTA Beta* is used during Low and Ultra-Low power modes. The Low Power Beta value should be set to a *larger* value than the Normal Beta value, to maintain adequate sensitivity at lower sampling rates.

10.3.2 Direction

Negative delta values are typically ignored, as they typically indicate an unexpected decrease in signal. If a negative delta value exceeds the *Fast LTA Bound* threshold, the LTA will be updated using the *Fast LTA Beta* filter. This behaviour can be disabled by setting the *Bi-Directional* bit, or the sign of the delta can be inverted by setting the *Inverse* bit in the *ProxFusion Settings 0* register.

10.3.3 LTA Reseeding

The reseed function of the device will replace the filtered counts and the long-term average value of the channel with the latest sampled counts value to reset the environmental reference of the channel. This may be necessary in certain instances when the Button event gets incorrectly stuck in an activation. Detection of stuck states is controlled by the [Touch Timeout](#) and [Proximity Timeout](#) parameters. If any of the Button events remain active for the timeout duration, the LTA is reseeded automatically. This behaviour can be disabled by setting the timeout parameter to 0.

A *Reseed* command can also be given manually by setting the corresponding bit in [System Commands](#).

10.4 Automatic Tuning Implementation

The ATI is a sophisticated technology implemented in ProxFusion® devices to allow optimal performance of the devices for a wide range of sensing electrode designs, without modification to external components.

The ATI functions by using the [Base](#) and [Target](#) parameters to calculate appropriate [Divider](#) and [Compensation](#) values to achieve an LTA approximately equal to the ATI target value. Note that the base and target values are specified in terms of Linearised Counts, and the base value should always be larger than the target. Typical base and target values for inductive and capacitive sensing modes are shown in Table 10.1.

Table 10.1: Base and Target Range

Sensing Mode	Base		Target	
	Min	Max	Min	Max
Inductive Sensing	3500	8000	3500	8000
Capacitive Sensing	10000	30000	4500	10000

The sensitivity of the touch channel can be adjusted by configuring the [ATI Base](#) and [ATI Target](#) registers. The ATI parameters' relationship to sensitivity is generally described as:

$$\text{Sensitivity} \propto \frac{\text{ATI Base}}{\text{ATI Target}}$$

To increase the sensitivity of the touch sensor, the Target value can be decreased. To reduce the sensitivity, the Base value can be decreased.

If the ATI algorithm cannot achieve a counts value within the ATI Band, the IQS397 will set the channel's ATI Error flag.

The Coarse Gain parameter in the [ProxFusion Dividers](#) register can be tuned in the GUI. The ATI will then adjust the Fine Divider parameter until the counts reach the base value. The Coarse Gain should be manually adjusted at design time until the Fine Divider reaches a value between '4' and '14' after ATI. It can then be fixed across production.

10.4.1 Automatic Re-ATI

One of the most important features of the automatic Re-ATI functionality of the IQS397 is that it allows easy and fast recovery from an incorrect ATI, such as when performing ATI during user interaction with the sensor. It is always recommended to have the automatic Re-ATI functionality enabled. When a Re-ATI is performed on the IQS397, the *ATI Event* status bit will be set momentarily to indicate that this has occurred.

An automatic Re-ATI operation is performed when the reference of a channel drifts outside the acceptable range around the ATI Target, which is defined by the *ATI Band* parameter. Automatic Re-ATI is also triggered on ATI Error states.

10.5 Debouncing and Hysteresis

Each of the Button event provides two mechanisms to prevent jitter: debouncing and hysteresis.

Debouncing occurs when the Button delta initially crosses the threshold. It forces the IQS397 to perform a number of quick measurements (at Normal Power report rate), checking that all measurements exceed the threshold. The event's *Debouncing* flag is set as long as debouncing is active. Once debouncing is complete, the event's *Active* flag is set.

The number of high-frequency measurements to execute can be configured independently for entering or exiting the event's active state in the *Debounce* register. Setting the debounce values to '0' or '1' will disable debouncing.

Hysteresis allows the channel to use different enter and exit thresholds for an event. Once the event has entered the active state by exceeding the normal threshold value, the exit threshold is calculated as

$$\text{Exit Threshold} = \text{Threshold} \times \left(1 - \frac{\text{Hysteresis Value}}{256} \right) \quad (3)$$

For example, with a Button threshold of 100 counts, and a hysteresis value of 50, the Button event will enter the Active state when the delta exceeds 100 counts, and will exit the Active state when the delta drops down to $100 \times (1 - 50/256) = 80$ counts.

10.6 Power Mode Timeout

In order to optimise the power consumption and the performance, the power modes are "stepped" by default in order to move to power efficient modes when no interaction has been detected for a certain (configurable) time, known as the "power mode timeout".

10.7 Sensor Setup

10.7.1 Channel Setup

The channel sensitivity and report rate can be adjusted using two input pins on the IQS397. For more information see Section 11.1.

10.7.2 Channel Default Settings

The default settings for the channel sensitivity, report rate, proximity and touch event timeout are shown below.

Table 10.2: Default Channel Settings

Order Codes	Prox Timeout [s]	Touch Timeout [s]	Sampling Period [ms]		Sensitivity	
			Slow	Fast	Low	High
IQS397-0xx IQS397-1xx	20	20	200	43	Base: 5000 Target: 5000	Base: 4000 Target: 4000
IQS397-2xx					Base: 10000 Target: 6000	Base: 10000 Target: 5000

10.7.3 Charge Transfer Frequency

The charge transfer frequency (f_{xfer}) is set to a default of 14 MHz for the IQS397-0xx and IQS397-1xx order codes, and 875 kHz for the IQS397-2xx order code unless otherwise indicated. F_{OSC} can be used as the Tx frequency by setting the F_{OSC} Tx Frequency bit in the [Sensor Setup](#) register.

10.8 Watchdog Timer

The IQS397 implements a hardware watchdog timer. The watchdog timer is set to expire after the default 1023 ms if not reset and it will trigger a software reset upon expiration. The watchdog timer period is configurable in the [ULP And Watchdog Settings](#) register.

During I²C communication the watchdog timer will reset whenever a read or write occurs. If the master initiates communication by sending an I²C START condition and does not complete the I²C transaction within 1023 ms, the IQS397 device will reset.

The I²C transaction is completed either when an I²C STOP notification is sent by the master or when the master ends the communication as described in Section 12.9.

10.9 Hardware Reset

The MCLR pin (active low) can be used to hard reset the device. For more details see Section 4.7.

11 Basic Standalone Functionality

11.1 Input Pin Functionality

The IQS397 offers two input pins that can be used to adjust the sensitivity and report rate. Table 11.1 shows the different input pin configurations.

Table 11.1: IQS397 input pin description

Input pin ⁱ	VDD ⁱⁱ	VSS ⁱⁱⁱ
InputA	High sensitivity	Low sensitivity
InputB	High report rate	Low report rate

Note: In standalone mode, debugging is not possible when InputA is shorted to VSS. Both InputA and Output must have pull-up resistors connected.

11.2 Output Pin Functionality

The Output pin is used to indicate when a touch event has occurred. This pin is configured as a push-pull active low pin and is set to VSS when a touch enter / touch release is detected. When a touch enter is detected, the Output pin is set to VSS for a configurable period (t_{out}), which is dependent on the report rate. After the time period t_{out} , the pin is set to VDD and will remain set to VDD while the touch state is active. When a touch release is detected, the pin is set to VSS again for a duration of t_{out} .

In summary, t_{out} can be set to either 43ms (high report rate) or 200ms (low report rate). A touch event will trigger two pulses on the Output pin, one pulse for the touch enter event and another pulse for the touch release event. Haptics is also triggered whenever a touch enter and touch release event occur.

The period (t_{out}), can be longer than the report rate period if Haptics pattern to output is longer than the report rate period (e.g. fast sampling and more half cycles to execute). The two output pulses can be joined when the report rate period is longer than the touch persistence (e.g. touched and released within the report rate period). The IQS397 power-on state description is shown in Table 11.2.

Table 11.2: IQS397 power-on state description

IC sensing option	POR state of the Output pin	Output pin state description
Inductive	High	Not in touch
Self-capacitive	High	Not in touch

11.3 Standalone Power On Sequence of the IQS397

On startup, the output of the IQS397 will follow the sequence shown in Figures 11.1 and 11.2. As shown in the figures below, the time interval t_{start_up} , is typically less than 500 ms and the time interval for checking the states of the input pins is typically less than 12 ms. After power-on-reset (POR), the input pin states are checked and the necessary settings are selected based on the strap options

ⁱ InputA and InputB must not be left floating.

ⁱⁱ Pins are shorted to VDD.

ⁱⁱⁱ Pins are shorted to VSS.

shown in Table 11.1. The I²C debug window is then made available with the ability to transition the device interface from standalone to I²C mode.

Note: If no interface transition occur then the device proceed into a complete standalone mode where the input pins are no longer read and no system settings can be changed. A POR is required in order to correctly configure the device whenever the state of any input pin has changed and/or whenever the system settings must be adjusted through the I²C debug window.

Figure 11.1: IQS397 output timing diagram (no touch at POR)

Figure 11.2: IQS397 output timing diagram (touch at POR)

12 I²C Interface

12.1 I²C Module Specification

The device features a standard two-wire I²C interface, complemented by a RDY (ready interrupt) line, supporting a maximum bit rate of up to 1 Mbit/s. The memory structures accessible over the I²C interface are byte-addressable with 16-bit address values. 16-bit or 32-bit values are packed with little-endian byte order and are stored in word-aligned addresses.

- > Standard two-wire interface with RDY interrupt line
- > *Fast-Mode Plus* I²C with up to 1 Mbit/s bit rate
- > 7-bit device address
- > 16-bit little-endian register addressing
- > One data byte stored per register address

12.2 I²C Address

The IQS397 has a default I²C address of 0x56 (0b1010110). The full address byte will thus be 0xAC (write) or 0xAD (read).

12.2.1 Reserved I²C Address

When communicating with the IQS397, it will acknowledge (ACK) communication attempts made to an additional address derived from its slave address. This derived address is obtained by flipping the least significant bit of the slave address.

For example, with the default slave address of 0x56, the derived address would be 0x57 (0b1010111), obtained by changing the LSB from '0' to '1'. This derived address is reserved for internal use and should not be used. Even though the device will acknowledge communication attempts to this address, it will not function as normal, and should therefore be avoided.

12.3 I³C Compatibility

This device is not compatible with an I³C bus due to clock stretching allowed for data retrieval.

12.4 Memory Map Addressing

All memory locations are 16-bit addressable in little-endian byte order.

12.5 Memory Map Data

Each 16-bit memory map address stores a single byte (8 bits), making the memory map byte-addressable. Since the data is packed in a little-endian sequence, a 16-bit value starting at, for example, address 0x1014 will have its least significant byte at address 0x1014 and its most significant byte at address 0x1015.

12.6 RDY/IRQ

The IQS397 has an open-drain active low RDY signal to inform the master that updated data is available. The IQS397 will pull the RDY line low to indicate that it has opened a communications window, or "RDY window", for the master to read the new updated data. While the master can communicate

with the device at any time according to the *Force Comms Method*, it is recommended to use the RDY signal for optimal power consumption. Integrating the RDY signal as an interrupt input allows the master MCU to read and write data efficiently.

The device provides both streaming and event modes. In streaming mode, the RDY line toggles continuously, with each sensing cycle, whereas in event mode the RDY toggles only when specific events occurs. The types of events that trigger the RDY window are configurable in the *Event Mask* register.

12.7 Read and Write Operations

12.7.1 I²C Read From Specific Address

A typical read operation is displayed in Figure 12.1. The master device waits for the RDY line of the IQS397 to go low, indicating the availability of new data and an available communication window. Once the RDY interrupt is triggered, the master initiates communication by sending a start condition followed by the device address and a write command. The IQS397 responds with an acknowledgement, after which the master device will transmit two bytes defining the register address. The master then sends a repeated start condition, followed by the device address with a read command. The IQS397 transmits data from the requested address and will continue to do so while the master acknowledges each byte. The read operation is ended when the master does not acknowledge the last byte received and produces a stop condition.

Figure 12.1: I²C Read Example — Read System Control Registers 0x1000 and 0x1001

12.7.2 I²C Write To Specific Address

The write operation is displayed in Figure 12.2. Similar to the read transaction, when the RDY interrupt is triggered, the master initiates communication by sending a start condition followed by the device address and a write command. The IQS397 responds with an acknowledgement, after which the master device transmits two bytes defining the register address. The slave acknowledges the register address bytes. The master may then write a series of bytes to the register address and the addresses that follow, with each byte being acknowledged by the slave. The write operation is ended when the master produces a stop condition.

Figure 12.2: I²C Write Example — Write Two Bytes to System Control Registers 0x1000 and 0x1001

12.7.3 Modifying Bits Over I²C

When modifying individual bits in a register, it is recommended to read the register first, make the necessary modifications, and then write the updated value back to the IQS397 register to prevent unintentional bit changes.

For example, setting the *Ack Reset* bit and *Power Mode* setting would involve:

- > Read the *System Control* Registers (0x1000 and 0x1001) as illustrated in Figure 12.1.
- > Set the *Ack Reset* bit using the bitwise OR operator. For example:

READ_VALUE OR 0x01

- > Set the *Power Mode* setting by clearing the bit field using a bitwise AND operation, then setting the bit field value with an OR operation. For example, to set the *Power Mode* to 'Auto':

(READ_VALUE AND 0xF8) OR 0x02

- > Write the new values back over I²C, as shown in Figure 12.2.

Read-modify-write transactions should be done in a single communication window, using I²C restart conditions. Please refer to Section 12.9 for more information regarding multiple I²C transactions in a single communication window.

12.8 I²C Timeout

If the communication window is not serviced within the *I²C Timeout* period (in milliseconds), the session is ended (RDY goes HIGH), and processing continues as normal. This allows the system to continue and keep reference values up to date even if the master is not responsive. However, the corresponding data will be lost, so this should be avoided. The default I²C timeout period is set to 250 ms.

12.9 Terminate Communication

With the *Terminate Comms Window* setting enabled in the *Power Settings* register, a standard I²C STOP ends the current communication window. If multiple I²C transactions need to be done, then they should be strung together using repeated-start conditions instead of giving a STOP. Allowing an I²C STOP to terminate the communication window is the recommended method, as illustrated in Figures 12.1 and 12.2.

This behaviour can be temporarily disabled by clearing the *Terminate Comms Window* setting. In this case, an I²C STOP will NOT terminate the communication window. Instead, the communication window can be closed manually, as desired, by setting the *Terminate Comms Window* bit as the final I²C transaction, followed by a STOP.

12.10 Invalid Communications Return

The device will give an invalid communication response (0xEE) under the following conditions:

- > The host is trying to read from a memory map register that does not exist.
- > The host is trying to read from the device outside a communication window (while RDY is high).

12.11 Event Mode Communication

The device can be set up to bypass the communication window when no activity is sensed by setting the *Event Mode* bit in the *Power Settings* register. This is usually enabled since the master does not need to be interrupted unnecessarily during every cycle if no activity occurs. The communication will resume (RDY will indicate available data) if an enabled event occurs. It is recommended that the RDY be placed on an interrupt-on-pin-change input on the master.

Event mode can only be entered if the following requirements are met:

- > Events must be serviced by reading from the *Event Flags* register to ensure all events flags are cleared, otherwise continuous reporting (RDY interrupts) will persist after every cycle, similar to streaming mode.
- > The *Show Reset* bit in the *Device Status* register has been cleared by setting the *Ack Reset* bit in *System Commands*.

12.11.1 Events

Numerous events can be individually enabled in the *Event Mask* register to trigger communication in Event Mode:

- > Power mode changes
- > ATI events
- > Touch events
- > Proximity events
- > Haptics events

12.11.2 Force Communication

In streaming mode, the IQS397 I²C will provide RDY windows at regular intervals specified by the relevant power mode report rate. This will provide the master with regular opportunities to perform I²C communication as necessary.

If the device is placed in Event Mode or Halt Mode, the IQS397 will not open RDY windows unless certain conditions are met. A new RDY window can be requested by writing 0xFF over I²C, followed by a stop condition. After a short delay, the IQS397 will pull the RDY line low and open a new communication window. This is shown in Figure 12.3.

Figure 12.3: Force Comms Diagram

After a short delay, a new communication window will be made available, indicated by the RDY signal. The delay between the communication request and the opening of a RDY window (t_{wait}) is application specific, but will typically be under 2 milliseconds.

A Memory Map Descriptions

A.1 Version Information (0x00 – 0x09)

Address	Category	Name	IQS397-xxx		
			000	100	200
0x00	Version Information	Product Number	3072	3073	3074
0x01		Major Version	1	1	1
0x02		Minor Version	0	0	0
0x03	Reserved	Reserved			
0x04					
0x05 - 0x09	Reserved	Reserved			

A.2 System Commands (0x1000)

Bit	7	6	5	4	3	2	1	0
Description	Reserved		Trigger Haptics	Reseed	Reserved	ATI	Soft Reset	Ack Reset

- > **Bit 5: Trigger Haptics**
 - 0: No action
 - 1: Trigger Haptics
 - Bit automatically cleared
- > **Bit 4: Reseed ProxFusion Channel**
 - 0: No action
 - 1: Reseed the Proxfusion channel LTA
 - Bit automatically cleared
- > **Bit 2: ATI ProxFusion Channel**
 - 0: No action
 - 1: Perform ATI calibration of the ProxFusion channel
 - Bit automatically cleared
- > **Bit 1: Soft Reset**
 - 0: No action
 - 1: Soft reset the device
 - Bit automatically cleared
- > **Bit 0: Ack Reset**
 - 0: No action
 - 1: Acknowledge a device reset
 - Bit automatically cleared

A.3 Power Settings (0x1001)

Bit	7	6	5	4	3	2	1	0
Description	Terminate Comms	Interface Select		Reserved		Power Mode Setting		

- > **Bit 7: Terminate Comms on Stop**
 - 0: Keep I²C communications window open on I²C stop condition
 - 1: Close I²C communications window on I²C stop condition
- > **Bit 5-6: Interface select**
 - 0: Streaming mode enabled. An I²C communications window is opened every cycle.
 - 1: Event mode enabled. An I²C communications window is opened only if an enabled event occurs.
 - 2: Reserved
 - 3: Standalone mode. I²C is disabled.

- > Bit 0-2: **Power Mode Setting**
 - 0: Normal Power
 - 1: Ultra Low Power
 - 2: Auto

A.4 Event Masks (0x1002)

Bit	7	6	5	4	3	2	1	0
Description	Reserved		Over-Temperature Event	Haptics Event	Touch Event	Proximity Event	ATI Event	Power Mode Event

- > Bit 5: **Over-Temperature Event**
 - 0: Disabled
 - 1: Open an I²C communications window on over-temperature events
- > Bit 4: **Haptics Event**
 - 0: Disabled
 - 1: Open an I²C communications window on haptics events
- > Bit 3: **Touch Event**
 - 0: Disabled
 - 1: Open an I²C communications window on touch events
- > Bit 2: **Proximity Event**
 - 0: Disabled
 - 1: Open an I²C communications window on proximity events
- > Bit 1: **ATI Event**
 - 0: Disabled
 - 1: Open an I²C communications window on ATI events
- > Bit 0: **Power Mode Event**
 - 0: Disabled
 - 1: Open an I²C communications window on power mode changes

A.5 ULP, Autoresonance and Watchdog Settings (0x1003)

Bit	7	6	5	4	3	2	1	0
Description	Recommend Recalibrate	Disable Read-Only Check	Watchdog Period			AutoProx Enable	AutoProx Conversion	

- > Bit 7: **Recommend Recalibrate**
 - 0: Disabled
 - 1: Enabled
- > Bit 6: **Disable Read-Only Check**
 - 0: Disabled
 - 1: Enabled
- > Bit 3-5: **Watchdog Period**
 - 3: 33 ms
 - 4: 65 ms
 - 5: 257 ms
 - 6: 511 ms
 - 7: 1023 ms
- > Bit 2: **AutoProx Enable**
 - 0: AutoProx disabled
 - 1: AutoProx enabled
- > Bit 0-1: **AutoProx Conversion Setting**
 - 0: Update all channels and UIs after 4 AutoProx conversions
 - 1: Update all channels and UIs after 8 AutoProx conversions

- 2: Update all channels and UIs after 16 AutoProx conversions
- 3: Update all channels and UIs after 32 AutoProx conversions

A.6 ProxFusion Settings 0 (0x1012)

Bit	7	6	5	4	3	2	1	0
Description	ATI Mode		Dual Threshold	Inverse	Reserved			

- > Bit 6-7: **ATI Mode**
 - 0: Disabled
 - 1: Divider Only
 - 2: Compensation Only
 - 3: Divider And Compensation
- > Bit 5: **Dual Threshold**
 - Allow button events to trigger for both positive and negative delta values
 - 0: Disabled
 - 1: Enabled
- > Bit 4: **Inverse**
 - Set button events to trigger for negative deltas. May be necessary for inductive sensing.
 - 0: Disabled
 - 1: Enabled

A.7 ProxFusion Settings 1 (0x1013)

Bit	7	6	5	4	3	2	1	0
Description	Enable F _{OSC} Tx	Noise Algorithm	Sensing Mode		Conversion Frequency			

- > Bit 7: **F_{OSC} Tx**
 - 0: Disabled
 - 1: Run sensor with TX at F_{OSC} frequency. Recommended only for inductive sensing.
- > Bit 6: **Noise Algorithm**
 - 0: Disabled
 - 1: Enabled. Recommended only for capacitive sensing.
- > Bit 4-5: **Sensing Mode**
 - 0: Disabled
 - 1: Self-Capacitance
 - 2: Inductance
- > Bit 0-3: **Conversion Frequency**

The following are recommended example values:

 - 3: 1.750 MHz
 - 7: 0.875 MHz
 - 15: 0.4375 MHz

Note: The maximum recommended conversion frequency for capacitive sensing is 1 MHz.

A.8 Proximity Debounce (0x1028)

Bit	7	6	5	4	3	2	1	0
Description	Debounce Exit				Debounce Enter			

- > Bit 4-7: **Debounce Exit**
 - 4-bit value
 - Number of high-frequency samples while exiting proximity state
- > Bit 0-3: **Debounce Enter**

- 4-bit value
- Number of high-frequency samples while entering proximity state

A.9 Touch Debounce (0x102C)

Bit	7	6	5	4	3	2	1	0
Description	Debounce Exit				Debounce Enter			

- > Bit 4-7: **Debounce Exit**
 - 4-bit value
 - Number of high-frequency samples while exiting touch state
- > Bit 0-3: **Debounce Enter**
 - 4-bit value
 - Number of high-frequency samples while entering touch state

A.10 ProxFusion Dividers (0x103A)

Bit	15	14	13	12	11	10	9	8
Description	Reserved		Fine Divider					Coarse Gain

Bit	7	6	5	4	3	2	1	0
Description	Coarse Gain							

- > Bit 9-13: **Fine Divider**
 - 5-bit value
- > Bit 0-8: **Coarse Gain**
 - 9-bit value

A.11 ProxFusion Compensation (0x103A)

Bit	15	14	13	12	11	10	9	8
Description	Reserved	Compensation Divider					Compensation Selection	

Bit	7	6	5	4	3	2	1	0
Description	Compensation Selection							

- > Bit 10-14: **Compensation Divider**
 - 5-bit value
- > Bit 0-9: **Compensation**
 - 10-bit value

A.12 Haptics Control (0x103E)

Bit	15	14	13	12	11	10	9	8
Description	Reserved							

Bit	7	6	5	4	3	2	1	0
Description	Reserved					Cancel Haptics	Trigger Haptics	Enable Haptics

- > Bit 2: **Cancel Haptics**

- 0: Haptics Output Enabled
- 1: Haptics Output Disabled
- Bit automatically cleared
- > Bit 1: **Trigger Haptics**
 - 0: Haptics not triggered
 - 1: Haptics triggered
 - Bit automatically cleared
- > Bit 0: **Enable Haptics**
 - 0: Haptics Disabled
 - 1: Haptics Enabled

A.13 Over-Temperature Settings (0x103F)

Bit	15	14	13	12	11	10	9	8
Description	Reserved							
Bit	7	6	5	4	3	2	1	0
Description	Reserved			Enable Hysteresis	Reserved			

- > Bit 4: **Enable Hysteresis**
 - 0: Hysteresis Disabled
 - 1: Hysteresis Enabled

A.14 H-Bridge Setup (0x1042)

Bit	15	14	13	12	11	10	9	8
Description	Reserved			Ground Inactive Pins	Reserved	Drive strength Select		
Bit	7	6	5	4	3	2	1	0
Description	Reserved		Slew Rate		Slew Rate Protection	Shoot-through protection	Over-Temperature Protection	Over-Current Protection

- > Bit 12: **Ground Inactive Pins**
 - 0: Float M+ and M- when motor is not being driven
 - 1: Pull M+ and M- to ground when motor is not being driven
- > Bit 8-10: **Drive Strength**
 - 0: DRV_{OFF}
 - 1: DRV_1
 - 2: DRV_{2A}
 - 3: DRV_{2B}
 - 4: DRV_3
 - 5: DRV_5
- > Bit 4-5: **Slew Rate Selection**
 - 0: 20V/us
 - 1: 40V/us
 - 2: 80V/us
 - 3: 160V/us
- > Bit 3: **Slew Rate Protection**
 - 0: Slew Rate Protection Disabled
 - 1: Slew Rate Protection Enabled
- > Bit 2: **Shoot-Through Protection**
 - 0: Shoot-Through Protection Disabled

- 1: Shoot-Through Protection Enabled
- > Bit 1: **Over-Temperature Protection**
 - 0: Over-Temperature Protection Disabled
 - 1: Over-Temperature Protection Enabled
- > Bit 0: **Over-Current Protection**
 - 0: Over-Current Protection Disabled
 - 1: Over-Current Protection Enabled

A.15 Autoresonance Setup (0x1048)

Bit	7	6	5	4	3	2	1	0
Description	Autoresonance Backoff							Enable Autoresonance

- > Bit 1-7: **Autoresonance Backoff**
 - 6-bit value
- > Bit 0: **Enable Autoresonance**
 - 0: Disable autoresonance
 - 1: Enable autoresonance

A.16 Drive Settings (0x1049)

Bit	7	6	5	4	3	2	1	0
Description	Amplitude		Half Cycles			Delay Braking	Enable Braking	Invert Start

- > Bit 6-7: **Amplitude**
 - 0: 25%
 - 1: 50%
 - 2: 75%
 - 3: 100%
- > Bit 3-5: **Half Cycles**
 - 0: 1 half cycle
 - 1: 2 half cycles
 - 2: 3 half cycles
 - 3: 4 half cycles
 - 4: 5 half cycles
 - 5: 6 half cycles
 - 6: 7 half cycles
 - 7: 8 half cycles
- > Bit 2: **Braking Delay**
 - 0: Brake immediately after driving waveform
 - 1: Delay one half cycle after driving waveform before braking
- > Bit 1: **Enable Braking**
 - 0: Disable braking
 - 1: Enable braking
- > Bit 0: **Invert Start**
 - 0: Start Waveform on M+
 - 1: Start Waveform on M-

A.17 Power Mode Flags (0x2000)

Bit	7	6	5	4	3	2	1	0
Description	Reserved						Power Mode	

> Bit 0-1: **Power Mode**

- 0: Normal Power
- 1: Ultra Low Power

A.18 Device Status (0x2001)

Bit	7	6	5	4	3	2	1	0
Description	Reserved						AutoProx Error	Show Reset

> Bit 1: **AutoProx Error**

- 0: Disabled
- 1: An error occurred with the AutoProx limits. The device will perform regular measurements rather than AutoProx conversions in Ultra Low power mode.

> Bit 0: **Show Reset**

- 0: Disabled
- 1: System reset event occurred

A.19 System Event Flags (0x2002)

Bit	7	6	5	4	3	2	1	0
Description	Reserved		Over-Temperature Event	Haptics Event	Touch Event	Proximity Event	ATI Event	Power Mode Event

> Bit 5: **Over-Temperature Event**

- 0: No event
- 1: Over-Temperature event occurred
- Cleared on read

> Bit 4: **Haptics Event**

- 0: No event
- 1: Haptics event occurred
- Cleared on read

> Bit 3: **Touch Event**

- 0: No event
- 1: Touch event occurred
- Cleared on read

> Bit 2: **Proximity Event**

- 0: No event
- 1: Proximity event occurred
- Cleared on read

> Bit 1: **ATI Event**

- 0: No event
- 1: ATI event occurred
- Cleared on read

> Bit 0: **Power Mode Event**

- 0: No event
- 1: Power mode change occurred
- Cleared on read

A.20 ProxFusion States (0x2003)

Bit	7	6	5	4	3	2	1	0
Description	Reserved						ATI Error	Reserved

- > Bit 1: **ATI Error**
 - 0: No error
 - 1: ProxFusion channel failed to calibrate correctly

A.21 Info Flags (0x2004)

Bit	7	6	5	4	3	2	1	0
Description	Reserved				Report Rate	Sensitivity	Debounce	Output State

- > Bit 3: **Report Rate**
 - 0: Slow sampling
 - 1: Fast Sampling.
- > Bit 2: **Sensitivity**
 - 0: Low sensitivity
 - 1: High sensitivity.
- > Bit 1: **Debounce**
 - 0: Button UI not currently debouncing
 - 1: Button UI currently debouncing by sampling at normal power report rate.
- > Bit 0: **Output State**
 - 0: Button UI delta currently below threshold
 - 1: Button UI delta currently above threshold. Button is considered “pressed”.

A.22 Button Event Flags (0x2005)

Bit	7	6	5	4	3	2	1	0
Description	Reserved					Touch Event	Proximity Event	LTA Halt

- > Bit 2: **Touch Event**
 - 0: No event
 - 1: Touch event. *Output State* transitioned from '0' to '1'.
- > Bit 1: **Proximity Event**
 - 0: No event
 - 1: Proximity event.
- > Bit 0: **LTA Halt**
 - 0: LTA is filtering normally
 - 1: LTA filter is halted to improve channel sensitivity.

B Revision History

Release	Date	Changes
v 1.0	April 2025	Initial release.
v 1.1	June 2025	IQS397-0xx, IQS397-1xx, and IQS397-2xx order codes added.
