Easy Mx PRO™ v7
for STM32 ARM®

Many on-board modules
Multimedia peripherals
Easy-add extra boards
mikroBUS™ sockets
Two connectors for each port
Amazing Connectivity
Fast USB 2.0 programmer and In-Circuit Debugger

186 microcontrollers supported
The ultimate STM32 board
To our valued customers

EasyMx PRO™ v7 for STM32 is our first development board for STM32 devices. We have put all of our knowledge that we gained in the past 10 years of developing embedded systems into it's design, functionality and quality. It may be our first STM32 development board, but it sure looks and feels like it's our 7th.

You made the right choice. But the fun has only just begun!

Nebojsa Matic,
Owner and General Manager
of MikroElektronika

ARM® Cortex™-M3 and Cortex™-M4 are increasingly popular microcontrollers. They are rich with modules, with high performance and low power consumption, so creating a development board the size of EasyMx PRO™ v7 for STM32 was really a challenge. We wanted to put as many peripherals on the board as possible, to cover many internal modules. We have gone through a process of fine tuning the board’s performance, and used 4-layer PCB to achieve maximum efficiency. Finally, it had met all of our expectations, and even exceeded in some. We present you the board which is powerful, well organized, with on-board programmer and debugger and is ready to be your strong ally in development.

*EasyMx PRO™ v7 development Team*

---

**Introduction**

**Two connectors for each port**

Amazing connectivity

EasyMx PRO™ v7 for STM32 is all about connectivity. Having two different connectors for each port, you can connect accessory boards, sensors and your custom electronics easier than ever before.

**Everything is already here**

**mikroProg™ on board**

Powerful on-board mikroProg™ programmer and hardware debugger can program and debug over 180 STM32 ARM® microcontrollers. You will need it, whether you are a professional or a beginner.

**Ready for all kinds of development**

**Multimedia peripherals**

TFT 320x240 with touch panel, stereo mp3 codec, audio input and output, navigation switch and microSD card slot make a perfect set of peripherals for multimedia development.

**For easier connections**

**mikroBUS™ support**

Just plug in your Click™ board, and it’s ready to work. We picked up a set of the most useful pins you need for development and made a pinout standard you will enjoy using.
STM32F107VCT6 is the default microcontroller

**STM32F107VCT6** is the default chip of EasyMx PRO™ v7 for STM32. It belongs to ARM® Cortex™-M3 family. It has 72MHz frequency, **256K bytes** of Flash memory, **64K bytes** of general purpose SRAM, integrated Ethernet controller, **USB 2.0** (OTG, Host, Device), 80 General purpose **I/O pins** (mappable on 16 external interrupt), **4x16-bit timers**, **2x12-bit A/D** (16 channels), **2x12-bit D/A**, **5xUARTs**, internal Real time clock (**RTC**), **2xI2C**, **3xSPI** and **2xCAN** controllers. It has Serial wire debug (SWD) and JTAG interfaces for programming and debugging.

- **Great choice for both beginners and professionals**
- **Rich with modules**
- **Comes with examples for mikroC, mikroBasic and mikroPascal compilers**

**System Specification**

- **power supply**
  - 7-23V AC or 9-32V DC
  - or via USB cable (5V DC)

- **power consumption**
  - ~76mA when all peripheral modules are disconnected

- **board dimensions**
  - 266 x 220mm (10.47 x 8.66 inch)

- **weight**
  - ~500g (1.1 lbs)

---

**Package contains**

1. **Damage resistant protective box**
2. **EasyMx PRO™ v7 for STM32 board in antistatic bag**
3. **USB cable**
4. **User Manuals and Board schematics**
Power supply

Board contains switching power supply that creates stable voltage and current levels necessary for powering each part of the board. Power supply section contains specialized **MC33269DT3.3** power regulator which creates VCC-3.3V power supply, thus making the board capable of supporting 3.3V microcontrollers. Power supply unit can be powered in three different ways: with **USB power supply (CN20)**, using external adapters via adapter connector (CN30) or additional screw terminals (CN31). External adapter voltage levels must be in range of **9-32V DC and 7-23V AC**. Use jumper J9 to specify which power source you are using. Upon providing the power using either external adapters or USB power source you can turn on power supply by using **SWITCH 1** (Figure 3-1). Power **LED ON (Green)** will indicate the presence of power supply.

**Figure 3-2:** Power supply unit schematic

**Figure 3-1:** Power supply unit of EasyMx PRO™ v7 STM32
How to power the board?

1. With USB cable
   - Set J9 jumper to USB position
   To power the board with USB cable, place jumper J9 in USB position. You can then plug in the USB cable as shown on images 1 and 2, and turn the power switch ON.

2. Using adapter
   - Set J9 jumper to EXT position
   To power the board via adapter connector, place jumper J9 in EXT position. You can then plug in the adapter cable as shown on images 3 and 4, and turn the power switch ON.

3. With laboratory power supply
   - Set J9 jumper to EXT position
   To power the board using screw terminals, place jumper J9 in EXT position. You can then screw-on the cables in the screw terminals as shown on images 5 and 6, and turn the power switch ON.
Default MCU card

Microcontrollers are supported using specialized MCU cards containing 104 pins, which can be placed into the on-board female MCU socket. There are several types of cards which cover all microcontroller families of STM32 Cortex™-M3, as well as Cortex™-M4. The Default MCU card that comes with the EasyMx PRO™ v7 for STM32 package is shown on Figure 4-1. It contains STM32F107VCT6 microcontroller with on-chip peripherals and is a great choice for both beginners and professionals. After testing and building the final program, this card can also be taken out of the board socket and used in your final device.

STM32F107VCT6 is the default chip of EasyMx PRO™ v7. It has 72MHz frequency, 256K bytes of Flash memory, 64K bytes of general-purpose SRAM, integrated Ethernet controller, USB 2.0 (OTG, Host, Device), 80 General purpose I/O pins (mappable on 16 external interrupt), 4x16-bit timers, 2x12-bit A/D (16 channels), 2x12-bit D/A, 5xUARTs, internal Real time clock (RTC), 2xI2C, 3xSPI and 2xCAN controllers.

25MHz crystal oscillator. We carefully chose the most convenient crystal value that provides clock frequency which can be used directly, or with the PLL multipliers to create higher MCU clock value. MCU card also contains 32.768 kHz crystal oscillator which provides external clock for RTCC module.

USB communications lines. These two jumpers, when in USB position, connect D+ and D- lines of the on-board USB connector with PA11 and PA12 microcontroller pins. Since STM32F107VCT6 supports USB, jumpers are in USB position.

Ethernet transceiver. Default MCU card contains single-chip Ethernet physical (PHY) layer transceiver which provides additional Ethernet functionality to STM32F107VCT6 controller.

With STM32 Cortex™-M3 and Cortex™-M4 microcontrollers you have the ability to select specific boot space (User flash memory, system memory or embedded SRAM), depending on the boot pins value (BTO, PB2). Boot pins are set to ground (0) through 100K resistors. In order to set BTO and PB2 pins to VCC (1), you must push Sw11.1 and Sw11.2 DIP switches to ON position, Figure 4-2. The values on the BOOT pins are latched on the fourth rising edge of system clock after a reset.
Figure 4-2: Default MCU card and boot configuration schematic
How to properly place your MCU card into the socket?

Before you plug the microcontroller card into the socket, make sure that the power supply is turned off. Images below show how to correctly plug the card. First make sure that MCU card orientation matches the silkscreen outline on the EasyMx PRO™ v7 STM32 board MCU socket. Place the MCU card over the socket, so each male header is properly aligned with the female socket, as shown in Figure 4-4. Then put the MCU card slowly down until all the pins match the socket. Check again if everything is placed correctly and press the MCU card until it is completely plugged into the socket as shown in Figure 4-5. If done correctly, all pins should be fully inserted. Only now you can turn on the power supply.

1. Figure 4-3: On-board MCU socket has silkscreen markings which will help you to correctly orient the MCU card before inserting.

2. Figure 4-4: Place the MCU card on the socket so that pins are aligned correctly.

3. Figure 4-5 Properly placed MCU card.
Other supported MCU cards

MikroElektronika currently offers total of three populated MCU cards. Two with Cortex™-M3: **STM32F107VCT6** microcontroller (default), **STM32F207VGT6** microcontroller and one with Cortex™-M4: **STM32F407VGT6** microcontroller. You can also purchase empty PCB cards that you can populate on your own and solder any supported microcontroller you need in your development. There are total of four empty PCB cards available. This way your EasyMx PRO™ v7 for STM32 board becomes truly flexible and reliable tool for almost any of your ARM® projects. MCU cards can also be used in your final devices. For complete list of currently available MCU cards, please visit the board webpage:

http://www.mikroe.com/easymx-pro/stm32/

**NOTE:**

“HP” (High performance) - Empty MCU cards that support only high performance STM32F20x and STM32F40x microcontrollers family.

“ETH” (Ethernet) - Empty MCU cards with single-chip Ethernet PHY layer transceiver which provides additional Ethernet functionality to microcontrollers.
What is mikroProg™?

mikroProg™ is a fast programmer and debugger which is based on ST-LINK V2 programmer. Smart engineering allows mikroProg™ to support over 180 ARM® Cortex™-M3 and Cortex™-M4 devices from STM32 in a single programmer. It also features a powerful debugger which will be of great help in your development. Outstanding performance and easy operation are among its top features.

How do I start?

In order to start using mikroProg™, and program your microcontroller, you just have to follow two simple steps:

1. Install the necessary software
   - Install programmer drivers
   - Install mikroProg Suite™ for ARM® software

2. Power up the board, and you are ready to go.
   - Plug in the programmer USB cable
   - LINK LED should light up.

Installing programmer drivers

On-board mikroProg™ requires drivers in order to work. Drivers are located on the link below:

http://www.mikroe.com/downloads/get/1838/st_link_v2_usb_driver.zip

When you locate the drivers, please extract the setup file from the ZIP archive. You should be able to locate the driver setup file. Double click the setup file to begin installation of the programmer drivers.

**Step 1 - Start Installation**
Welcome screen of the installation. Just click on **Next** button to proceed.

**Step 2 - Select Destination**
Click **Change** button to select new destination folder or use the suggested installation path.

**Step 3 - Installing drivers**
Drivers are installed automatically in a matter of seconds.

**Step 4 - Finish installation**
You will be informed if the drivers are installed correctly. Click on **Finish** button to end installation process.
Programming software

mikroProg Suite™ for ARM®

On-board mikroProg™ programmer requires special programming software called mikroProg Suite™ for ARM®. This software is used for programming of all supported microcontroller families with ARM® Cortex™-M3 and Cortex™-M4 cores. Software has intuitive interface and SingleClick™ programming technology. To begin, first locate the installation archive on our web site:

http://www.mikroe.com/downloads/get/1809/mikroprog_suite_for_arm.zip

After downloading, extract the package and double click the executable setup file, to start installation.

Quick Guide

1. Click the Detect MCU button in order to recognize the device ID.
2. Click the Read button to read the entire microcontroller memory. You can click the Save button to save it to target HEX file.
3. If you want to write the HEX file to the microcontroller, first make sure to load the target HEX file. You can drag-n-drop the file onto the software window, or use the Load button to open Browse dialog and point to the HEX file location. Then click the Write button to begin programming.
4. Click the Erase button to wipe out the microcontroller memory.

Figure 5-2: mikroProg Suite™ for ARM® window
Hardware Debugger

What is Debugging?

Every developer comes to a point where he has to monitor the code execution in order to find errors in the code, or simply to see if everything is going as planned. This hunt for bugs, or errors in the code is called debugging. There are two ways to do this: one is the software simulation, which enables you to simulate what is supposed to be happening on the microcontroller as your code lines are executed, and the other, most reliable one, is monitoring the code execution on the chip itself. And this latter one is called hardware debugging. “hardware” means that it is the real deal - code executes right on the target device.

What is hardware debugger?

The on-board mikroProg™ programmer supports hardware debugger - a highly effective tool for a Real-Time debugging on hardware level. The debugger enables you to execute your program on the host STM32 microcontroller and view variable values, Special Function Registers (SFR), RAM, CODE and EEPROM memory along with the code execution on hardware. Whether you are a beginner, or a professional, this powerful tool, with intuitive interface and convenient set of commands will enable you to track down bugs quickly. mikroProg debugger is one of the fastest, and most reliable debugging tools on the market.

Supported Compilers

All MikroElektronika compilers, mikroC™, mikroBasic™ and mikroPascal™ for ARM® natively support mikroProg™ for STM32, as well as other compilers, including KEIL®, IAR®. Specialized DLL module allows compilers to exploit the full potential of fast hardware debugging. Along with compilers, make sure to install the appropriate programmer drivers and mikroProg Suite™ for ARM® programming software, as described on pages 14 and 15.

How do I use the debugger?

When you build your project for debugging, and program the microcontroller with this HEX file, you can start the debugger using [F9] command. Compiler will change layout to debugging view, and a blue line will mark where code execution is currently paused. Use debugging toolbar in the Watch Window to guide the program execution, and stop anytime. Add the desired variables to Watch Window and monitor their values.
Here is a short overview of which debugging commands are supported in MikroElektronika compilers. You can see what each command does, and what are their shortcuts when you are in debugging mode. It will give you some general picture of what your debugger can do.

</table>
Input/Output Group

One of the most distinctive features of EasyMx PRO™ v7 for STM32 are it’s Input/Output PORT groups. They add so much to the connectivity potential of the board.

Everything is grouped together

PORT headers, PORT buttons and PORT LEDs are next to each other, and grouped together. It makes development easier, and the entire EasyMx PRO™ v7 for STM32 cleaner and well organized. We have also provided an additional PORT headers on the right side of the board, so you can access any pin you want from that side of the board too.

Tri-state pull-up/down DIP switches

Tri-state DIP switches, like SW1 on Figure 6-3, are used to enable 4K7 pull-up or pull-down resistor on any desired port pin. Each of these switches has three states:
1. middle position disables both pull-up and pull-down feature from the PORT pin
2. up position connects the resistor in pull-up state to the selected pin
3. down position connects the resistor in pull-down state to the selected PORT pin.

Figure 6-2: Tri-state DIP switch on PORTA/H

Button press level tri-state DIP switch is used to determine which logic level will be applied to port pins when buttons are pressed.

Figure 6-3: Schematic of the single I/O group connected to microcontroller PORTA/H
**Figure 6-4**: IDC10 male headers enable easy connection with MikroElektronika accessory boards

---

**Headers**

With enhanced connectivity as one of the key features of EasyMx PRO™ v7 for STM32, we have provided **two connection headers for each PORT**. I/O PORT group contains one male IDC10 header (like CN1 Figure 6-3). There is **one more IDC10 header** available on the right side of the board, next to DIP switches (like CN4 on Figure 6-3). These headers can be used to connect accessory boards with IDC10 female sockets.

**Buttons**

The logic state of all microcontroller digital inputs may be changed using **push buttons**. Tri-state DIP switch Sw10 is available for selecting which logic state will be applied to corresponding MCU pin when button is pressed, for each I/O port separately. If you, for example, place Sw10.1 in VCC position, then pressing of any push button in PORTA/H I/O group will apply logic one to the appropriate microcontroller pin. The same goes for GND. If DIP switch is in the middle position neither of two logic states will be applied to the appropriate microcontroller pin. You can disable pin protection 220ohm resistors by placing jumpers J6 and J7, which will connect your push buttons directly to VCC or GND. Be aware that doing so you may accidentally damage MCU in case of wrong usage.

**LEDs**

**LED (Light-Emitting Diode)** is a highly efficient electronic light source. When connecting LEDs, it is necessary to place a current limiting resistor in series so that LEDs are provided with the current value specified by the manufacturer. The current varies from 0.2mA to 20mA, depending on the type of the LED and the manufacturer. The EasyMx PRO™ v7 for STM32 board uses low-current LEDs with typical current consumption of 0.2mA or 0.3mA. Board contains 67 LEDs which can be used for visual indication of the logic state on PORT pins. An active LED indicates that a logic high (1) is present on the pin. In order to enable PORT LEDs, it is necessary to enable the corresponding DIP switch on Sw15 (Figure 6-6).

**Reset Button**

In the far upper right section of the board, there is a **RESET button**, which can be used to manually reset the microcontroller.

---

*EasyMx PRO™ v7*
mikroBUS™ sockets

Easier connectivity and simple configuration are imperative in modern electronic devices. Success of the USB standard comes from its simplicity of usage and high and reliable data transfer rates. As we in MikroElektronika see it, Plug-and-Play devices with minimum settings are the future in embedded world too. This is why our engineers have come up with a simple, but brilliant pinout with lines that most of today’s accessory boards require, which almost completely eliminates the need of additional hardware settings. We called this new standard the mikroBUS™. EasyMx PRO™ v7 for STM32 supports mikroBUS™ with two on-board sockets. As you can see, there are no additional DIP switches, or jumper selections. Everything is already routed to the most appropriate pins of the microcontroller sockets.

mikroBUS™ host connector

Each mikroBUS™ host connector consists of two 1x8 female headers containing pins that are most likely to be used in the target accessory board. There are three groups of communication pins: SPI, UART and I²C communication. There are also single pins for PWM, Interrupt, Analog input, Reset and Chip Select. Pinout contains two power groups: +5V and GND on one header and +3.3V and GND on the other 1x8 header.

mikroBUS™ pinout explained

- AN - Analog pin
- RST - Reset pin
- CS - SPI Chip Select line
- SCK - SPI Clock line
- MISO - SPI Slave Output line
- MOSI - SPI Slave Input line
- +3.3V - VCC-3.3V power line
- GND - Reference Ground
- PWM - PWM output line
- INT - Hardware Interrupt line
- RX - UART Receive line
- TX - UART Transmit line
- SCL - I²C Clock line
- SDA - I²C Data line
- +5V - VCC-5V power line
- GND - Reference Ground

Integrate mikroBUS™ in your design

mikroBUS™ is not made only to be a part of our development boards. You can freely place mikroBUS™ host connectors in your final PCB designs, as long as you clearly mark them with mikroBUS™ logo and footprint specifications. For more information, logo artwork and PCB files visit our website:

http://www.mikroe.com/mikrobus/
MikroElektronika’s portfolio of over 200 accessory boards is now enriched by an additional set of mikroBUS™ compatible Click Boards™. Almost each month several new Click boards™ are released. It is our intention to provide the community with as much of these boards as possible, so you will be able to expand your EasyMx PRO™ v7 for STM32 with additional functionality with literally zero hardware configuration. Just plug and play. Visit the Click boards™ webpage for the complete list of available boards:

http://www.mikroe.com/click/
USB-UART A

The UART (universal asynchronous receiver/transmitter) is one of the most common ways of exchanging data between the MCU and peripheral components. It is a serial protocol with separate transmit and receive lines, and can be used for full-duplex communication. Both sides must be initialized with the same baud rate, otherwise the data will not be received correctly.

Modern PC computers, laptops and notebooks are no longer equipped with RS-232 connectors and UART controllers. They are nowadays replaced with USB connectors and USB controllers. Still, certain technology enables UART communication to be done via USB connection. Controllers such as FT232RL from FTDI® convert UART signals to the appropriate USB standard.

USB-UART A communication is being done through a FT232RL controller, USB connector (CN22), and microcontroller UART module. To establish this connection, you must connect TX and RX lines of the FT232RL to the appropriate pins of the microcontroller. This selection is done using DIP switches SW12.1 and SW12.2.

In order to enable USB-UART A communication, you must push SW12.1 (PA9) and SW12.2 (PA10) to ON position. This connects the RX and TX lines to PA9 and PA10 microcontroller pins.

In order to use USB-UART A module on EasyMx PRO™ v7 for STM32, you must first install FTDI drivers on your computer. Drivers can be found on link below:

http://www.ftdichip.com/Drivers/VCP.htm
If you need to use more than one USB-UART in your application, you have another USB-UART connector available on the board too. Both available USB-UART modules can operate at the same time, because they are routed to separate microcontroller pins.

USB-UART B communication is being done through a FT232RL controller, USB connector (CN23), and microcontroller UART module. To establish this connection, you must connect TX and RX lines of the FT232RL to the appropriate pins of the microcontroller. This selection is done using DIP switches SW12.3 and SW12.4.

When using either USB-UART A or USB-UART B, make sure to disconnect all devices and additional boards that could interfere with the signals and possibly corrupt the sent or received data.

In order to enable USB-UART B communication, you must push SW12.3 (PD5) and SW12.4 (PD6) to ON position. This connects the RX and TX lines to PD5 and PD6 microcontroller pins.

In order to use USB-UART B module on EasyMx PRO™ v7 for STM32, you must first install FTDI drivers on your computer. Drivers can be found on the link below:

http://www.ftdichip.com/Drivers/VCP.htm
USB is the acronym for **Universal Serial Bus**. This is a very popular industry standard that defines cables, connectors and protocols used for communication and power supply between computers and other devices. EasyMx PRO™ v7 for STM32 contains USB HOST connector (CN24) for USB Standard Type A plug, which enables microcontrollers that support USB communication to establish a connection with the target device (e.g. USB Keyboard, USB Mouse, etc). USB host also provides the necessary 5V power supply to the target via **TPS2041B** IC. Detection whether USB device is connected to HOST connector can be done through **VBUS** line. Connection of USB HOST **VBUS** line and **PA10** pin is established when **SW10.7** is on.

**Figure 10-1: USB host connection schematic**

**Figure 10-2: Powering USB device through PSW line**

You can enable or disable power supply to USB device connected to HOST, through microcontroller **PA10** pin. In order to connect EN TPS2041B IC pin to microcontroller, you must push **SW10.8** to **ON** position.
EasyMx PRO™ v7 for STM32 also contains USB DEVICE connector (CN26) which enables microcontrollers that support USB communication to establish a connection with the target host (eg. PC, Laptop, etc). It lets you build a slave USB device (HID, Composite, Generic, etc.). Connector supports USB Standard Type B plug. Detection whether USB device is connected to HOST can be done through VBUS line. This line is traced to microcontroller PA9 pin. Connection of USB DEVICE VCC line and PA9 pin is established when SW12.7 DIP switch is in ON position. When connected to HOST, dedicated amber-colored power LED will light up as well. This VCC line cannot be used for powering the board. It’s only used for detecting connection.

You can detect whether USB device is plugged into the USB device connector using VBUS power detection line (PA9). Before using this feature, you must connect PA9 pin to USB connector using SW12.7 DIP switch.
Ethernet is a popular computer networking technology for local area networks (LAN). Systems communicating over Ethernet divide a stream of data into individual packets called frames. Each frame contains source and destination addresses and error-checking data so that damaged data can be detected and re-transmitted. EasyMx PRO™ v7 for STM32 features standard RJ-45 connector which enables microcontrollers that support Ethernet communication to establish a connection with a computer, router or other devices. All four Ethernet lines (TPOUT+, TPOUT-, TPIN+ and TPIN-) are routed directly to the MCU card socket and cannot be accessed via PORT headers. Additional signalization LEDs (green and yellow) are provided on the Board next to RJ-45 connector.

Figure 12-1: Ethernet connection schematic
Controller Area Network (CAN or CAN bus) is a vehicle bus standard designed to allow microcontrollers and devices to communicate with each other within a vehicle without a host computer. CAN is a message-based protocol, designed specifically for automotive applications but now also used in other areas such as industrial automation and medical equipment. EasyMx PRO™ v7 for STM32 is equipped with SN65HVD230 – a 3.3V CAN Transceiver and a pair of screw terminals which provide microcontrollers with integrated CAN controller with the necessary physical interface for CAN communication. Make sure to correctly connect negative and positive differential communication lines before using this module.

In order to enable CAN communication, you must push SW12.5 (PD1) and SW12.6 (PD0) to ON position. This connects the TX and RX lines to appropriate microcontroller pins and its CAN module.
It's hard to imagine modern multimedia devices without high quality audio reproduction modules. Sounds and music are almost as important as graphical user interfaces. Along with other multimedia modules, EasyMx PRO™ v7 for STM32 contains high end stereo VS1053 audio codec. It features Ogg Vorbis/MP3/AAC/WMA/FLAC/WAV/MIDI audio decoder, as well as an PCM/IMA ADPCM/Ogg Vorbis encoder on a single chip. Board also contains two stereo audio connectors for interfacing with standard 3.5mm stereo audio jacks. VS1053 receives the input bit stream through a serial input bus, which it listens to as a system slave. The input stream is decoded and passed through a digital volume control to an 18-bit oversampling, multi-bit, sigma-delta Digital to Analog Converter (DAC). The decoding is controlled via a serial control bus. In addition to the basic decoding, it is possible to add application specific features like DSP effects to the user RAM memory. You can build music players, audio recording devices, internet radio player applications, and much more.

Enabling Audio I/O

In order to use Audio I/O module, you must connect data and Audio control lines of the microcontroller with the VS1053 audio codec. To do this, push Sw13.1-Sw13.7 switches to ON position. This will connect SPI data lines with MCU_SCK, MCU_MISO and MCU_MOSI microcontroller pins, and audio control and chip select lines with PC6, PC7, PC8 and PC9 pins.
Secure Digital (SD) is a non-volatile memory card format developed for use in portable devices. It comes in different packages and memory capacities. It is mostly used for storing large amounts of data. EasyMx PRO™ v7 for STM32 features the microSD card slot. The microSD form factor is the smallest card format currently available. It uses standard SPI user interface with minimum additional electronics, mainly used for stabilizing communication lines which can be significantly distorted at high transfer rates. Special ferrite is also provided to compensate the voltage and current glitch that can occur when pushing-in and pushing-out microSD card into the socket.

Enabling microSD

In order to access microSD card, you must enable SPI communication lines using Sw13.1 - Sw13.3 DIP switches, as well as Chip Select (CS) and Card Detect (CD) lines using Sw14.3 and Sw14.4 switches.
One of the most powerful ways of presenting data and interacting with users is through color displays and touch panel inputs. This is a crucial element of any multimedia device. EasyMx PRO™ v7 for STM32 features EasyTFT board carrying 320x240 pixel 2.83” color TFT display with LED back-light and HX8347D controller. Each pixel is capable of showing 262,144 different colors.

TFT display is connected to microcontroller PORTE using standard 8080 parallel 8-bit interface, with additional control lines. Board features back-light driver which besides standard mode can also be driven with PWM signal in order to regulate brightness in 0 to 100% range.

### Driving Display Back-light

**Figure 16-1:** TFT display connection schematic

**Figure 16-2:** Turn on switches **SW11.3** and **SW11.4** to enable back-light

TFT display is enabled using **SW11.3-SW11.4** DIP switches. Back-light can be enabled in two different ways:

1. It can be turned on with full brightness using **SW11.3** switch.

2. Brightness level can be determined with PWM signal from the microcontroller, allowing you to write custom back-light controlling software. This back-light mode is enabled when both **SW11.3** and **SW11.4** switches are in ON position.

---

**In order to use PWM back-light both SW11.3 and SW11.4 switches must be enabled at the same time.**
Touch Panel controller

Touch panel is a glass panel whose surface is covered with two layers of resistive material. When the screen is pressed, the outer layer is pushed onto the inner layer and appropriate controllers can measure that pressure and pinpoint its location. This is how touch panels can be used as an input devices. EasyMx PRO v7 for STM32 is equipped with touch panel controller and connector for 4-wire resistive touch panels. It can very accurately register pressure at a specific point, representing the touch coordinates in the form of analog voltages, which can then be easily converted to X and Y values. Touch panel comes as a part of TFT 320x240 display.

Enabling Touch panel

Touch panel is enabled using SW11.5, SW11.6, SW11.7 and SW11.8 switches. They connect BOTTOM and LEFT lines of the touch panel with PB0 and PB1 analog inputs, and DRIVEA and DRIVEB with PB8 and PB9 digital outputs on microcontroller sockets. Make sure to disconnect other peripherals, LEDs and additional pull-up or pull-down resistors from the interface lines so they do not interfere with signal/data integrity.

Figure 17-2: Turn on switches SW11.5, SW11.6, SW11.7 and SW11.8 to enable Touch panel controller

Figure 17-1: Touch Panel controller and connection schematic

NOTE: VREF=1.8V
GLCD 128x64

Graphical Liquid Crystal Displays, or GLCDs, are used to display monochromatic graphical content, such as text, images, human-machine interfaces and other content. EasyMx PRO™ v7 for STM32 provides the connector and necessary interface for supporting GLCD with resolution of 128x64 pixels, driven by the KS108 or compatible display controller. Communication with the display module is done through CN32 display connector. Board is fitted with uniquely designed plastic display distancer, which allows the GLCD module to perfectly and firmly fit into place.

Display connector is routed to PORTE (control and data lines) of the microcontroller sockets. PORTE is also used by TFT display. You can control the display contrast using dedicated potentiometer P2. Full brightness display back-light can be enabled with SW13.3 switch, and PWM-driven back-light with SW13.4 switch.

In order to use PWM back-light both SW13.3 and SW13.4 switches must be enabled at the same time.

Connector pinout explained

- **CS1** and **CS2** - Controller Chip Select lines
- **VCC** - +5V display power supply
- **GND** - Reference ground
- **Vo** - GLCD contrast level from potentiometer P3
- **RS** - Data (High), Instruction (Low) selection line
- **R/W** - Determines whether display is in Read or Write mode.
- **E** - Display Enable line
- **D0-D7** - Data lines
- **RST** - Display reset line
- **Vee** - Reference voltage for GLCD contrast potentiometer P3
- **LED+** - Connection with the back light LED anode
- **LED-** - Connection with the back light LED cathode

![Figure 18-1: GLCD 128x64 connection schematic](image)
When working with multimedia applications it is far more intuitive to use a single joystick than several different push buttons that are more far apart. This is more natural for users and they can browse through on-screen menus, or even play games much easier. EasyMx PRO™ v7 for STM32 features navigation switch with five different positions: Up, Down, Left, Right and Center. Each of those acts as a button, and is connected to one of the following microcontroller pins: PD4, PB5, PD2, PA6, PC13 (respectively). Before using the navigation switch, it is necessary to pull-up mentioned microcontroller pins using tri-state DIP switches located in I/O groups. After pressing the navigation switch in desired direction, associated microcontroller pins are connected to GND, which can be detected in user software.
DS1820 is a digital temperature sensor that uses 1-wire® interface for its operation. It is capable of measuring temperatures within the range of -55 to 128°C, and provides ±0.5°C accuracy for temperatures within the range of -10 to 85°C. It requires 3V to 5.5V power supply for stable operation. It takes maximum of 750ms for the DS1820 to calculate temperature with 9-bit resolution. 1-wire® serial communication enables data to be transferred over a single communication line, while the process itself is under the control of the master microcontroller. The advantage of such communication is that only one microcontroller pin is used. Multiple sensors can be connected on the same line. All slave devices by default have a unique ID code, which enables the master device to easily identify all devices sharing the same interface. Board provides a separate socket (TS1) for the DS1820. Communication line with the microcontroller is established using SW14.5 or SW14.6 DIP switch (ON position).

Enabling DS1820 Sensor

EasyMx PRO™ v7 for STM32 enables you to establish 1-wire® communication between DS1820 and the microcontroller over PB10 or PA3 pin. The connection is done placing Sw14.5 or Sw14.6 DIP switch to ON position (Figure 20-3). When placing the sensor in the socket make sure that half-circle on the board’s silkscreen markings matches the rounded part of the DS1820 sensor. If you accidentally connect the sensor the other way, it may be permanently damaged. Make sure to disconnect other peripherals, LEDs and additional pull-up or pull-down resistors from the interface lines in order not to interfere with signal/data integrity.
The LM35 is a low-cost precision integrated-circuit temperature sensor, whose output voltage is linearly proportional to the Celsius (Centigrade) temperature. The LM35 thus has an advantage over linear temperature sensors calibrated in ° Kelvin, as the user is not required to subtract a large constant voltage from its output to obtain convenient Centigrade scaling. It has a linear +10.0 mV/°C scale factor and less than 60 μA current drain. As it draws only 60 μA from its supply, it has very low self-heating, less than 0.1°C in still air. EasyMx PRO™ v7 for STM32 enables you to get analog readings from the LM35 sensor in restricted temperature range from +2°C to +150°C. Board provides a separate socket (TS2) for the LM35 sensor in TO-92 plastic packaging. Readings are done with microcontroller using single analog input line, which is selected with DIP switch Sw14. Switch connects the sensor with PC0 microcontroller pin.

EasyMx PRO™ v7 for STM32 enables you to get analog readings from the LM35 sensor using PC0 microcontroller pin. The connection is done placing Sw14.7 DIP switch to ON position (Figure 21-3). When placing the sensor in the socket make sure that half-circle on the board’s silkscreen markings matches the rounded part of the LM35 sensor. If you accidentally connect the sensor the other way, it can be permanently damaged and you might need to replace it with another one. During the readings of the sensor, make sure that no other device uses the selected analog line, because it may interfere with the readings.

EasyMx PRO™ v7

Figure 21-4: LM35 connected to PC0 pin
**Flash memory** is a non-volatile storage chip that can be electrically erased and reprogrammed. It was developed from EEPROM (electrically erasable programmable read-only memory) and must be erased in fairly large blocks before these can be rewritten with new data. The high density NAND type must also be programmed and read in (smaller) blocks, or pages, while the NOR type allows a single machine word (byte) to be written or read independently. Flash memories come in different sizes and supporting different clock speeds. They are mostly used for mass storage, as in USB Flash Drives, which are very popular today.

EasyMx PRO™ v7 features **M25P80** Serial Flash Memory which uses **SPI communication interface** and has **8 Mbits** of available memory, organized as 16 sectors, each containing 256 pages. Each page is 256 bytes wide. Thus, the whole memory can be viewed as consisting of 4096 pages, or 1,048,576 bytes. Maximum clock frequency for READ instructions is 40MHz.

**What is SPI?**

The **Serial Peripheral Interface Bus** or SPI bus is a synchronous serial data link standard that operates in full duplex mode. It consists of four lines **MISO** (Master Input Slave Output), **MOSI** (Master Output Slave Input), **SCK** (Clock) and **CS** (Chip Select). Devices communicate in master/slave mode where the master device initiates the data frame. Multiple slave devices are allowed with individual slave select (chip select) lines.

**Enabling Serial Flash**

In order to connect Serial Flash Memory to the microcontroller you must enable **SW13.1, SW13.2, SW13.3 and SW13.8** switches. This connects SPI lines to **MCU_MOSI, MCU_MISO, MCU_SCK** and **PD7 (CS)** microcontroller pins.

---

**Figure 22-1:** Schematic of Serial Flash Memory module
**EEPROM**

EEPROM is short for **Electrically Erasable Programmable Read Only Memory**. It is usually a secondary storage memory in devices containing data that is retained even if the device loses power supply. Because of the ability to alter single bytes of data, EEPROM devices are used to store personal preference and configuration data in a wide spectrum of consumer, automotive, telecommunication, medical, industrial, and PC applications.

EasyMx PRO™ v7 for STM32 supports serial EEPROM which uses **I²C communication interface** and has **1024 bytes** of available memory. EEPROM itself supports single byte or 16-byte (page) write and read operations. Data rates are dependent of power supply voltage, and go up to **400 kHz** for 3.3V power supply.

### What is I²C?

I²C is a multi-master serial single-ended bus that is used to attach low-speed peripherals to computer or embedded systems. I²C uses only two open-drain lines, **Serial Data Line (SDA)** and **Serial Clock (SCL)**, pulled up with resistors. **SCL** line is driven by a master, while **SDA** is used as bidirectional line either by master or slave device. Up to 112 slave devices can be connected to the same bus. Each slave must have a unique address.
**ADC inputs**

Digital signals have **two discrete states**, which are decoded as **high** and **low**, and interpreted as **logic 1** and **logic 0**. Analog signals, on the other hand, are **continuous**, and can have any value within defined range. **A/D converters** are specialized circuits which can convert analog signals (voltages) into a digital representation, usually in form of an **integer number**. The value of this number is **linearly dependent** on the input voltage value. Most microcontrollers nowadays internally have A/D converters connected to one or more input pins. Some of the most important parameters of A/D converters are **conversion time** and **resolution**. Conversion time determines how fast can an analog voltage be represented in form of a digital number. This is an important parameter if you need fast data acquisition. The other parameter is resolution. Resolution represents the number of discrete steps that supported voltage range can be divided into. It determines the sensitivity of the A/D converter. Resolution is represented in maximum number of bits that resulting number occupies. Most microcontrollers have 10-bit resolution, meaning that maximum value of conversion can be represented with 10 bits, which converted to integer is $2^{10}=1024$. This means that supported voltage range, for example from 0-1.8V, can be divided into 1024 discrete steps of about 1.758mV. EasyMx PRO™ v7 for STM32 provides an interface in form of potentiometer for simulating analog input voltages that can be routed to any of the 5 supported analog input pins.

**Enabling ADC inputs**

In order to connect the output of the potentiometer P1 to PA3, PA4, PA5, PA6 or PC0 analog microcontroller inputs, you have to place the jumper J8 in the desired position. By moving the potentiometer knob, you can create voltages in range from **GND** to **VCC**.

---

**Figure 24-1:** Schematic of ADC input
Piezo Buzzer

Piezo electricity is the charge which accumulates in certain solid materials in response to mechanical pressure, but also providing the charge to the piezo electric material causes it to physically deform. One of the most widely used applications of piezo electricity is the production of sound generators, called piezo buzzers. Piezo buzzer is an electric component that comes in different shapes and sizes, which can be used to create sound waves when provided with analog electrical signal. EasyMx PRO™ v7 for STM32 comes with piezo buzzer which can be connected to PE14 microcontroller pin. Connection is established using Sw14.8 DIP switch. Buzzer is driven by transistor Q1 (Figure 25-1). Microcontrollers can create sound by generating a PWM (Pulse Width Modulated) signal - a square wave signal, which is nothing more than a sequence of logic zeros and ones. Frequency of the square signal determines the pitch of the generated sound, and duty cycle of the signal can be used to increase or decrease the volume in the range from 0% to 100% of the duty cycle. You can generate PWM signal using hardware capture-compare module, which is usually available in most microcontrollers, or by writing a custom software which emulates the desired signal waveform.

Supported sound frequencies

Piezo buzzer's resonant frequency (where you can expect it's best performance) is 3.8kHz, but you can also use it to create sound in the range between 2kHz and 4kHz.

Enabling Piezo Buzzer

In order to use the on-board Piezo Buzzer in your application, you first have to connect the transistor driver of piezo buzzer to the appropriate microcontroller pin. This is done using Sw14.8 DIP switch which connects it to PE14 pin.

How to make it sing?

Buzzer starts “singing” when you provide PWM signal from the microcontroller to the buzzer driver. The pitch of the sound is determined by the frequency, and amplitude is determined by the duty cycle of the PWM signal.
EasyMx PRO™ v7 for STM32 contains GND pins located in different sections of the board, which allow you to easily connect oscilloscope GND reference when you monitor signals on microcontroller pins, or signals of on-board modules.

1. GND is located below microSD section.
2. GND is located just above PORTE/H Input/Output Group.
3. GND is located below power supply region.

Figure 26-1: Three oscilloscope GND pins are conveniently positioned so different parts of the board can be reached with an oscilloscope probe.
What’s Next?

You have now completed the journey through each and every feature of EasyMx PRO™ v7 for STM32 board. You got to know its modules, organization, supported microcontrollers, programmer and debugger. Now you are ready to start using your new board. We are suggesting several steps which are probably the best way to begin. We invite you to join the users of EasyMx PRO™ brand. You will find very useful projects and tutorials and can get help from a large ecosystem of users. Welcome!

1. Compiler
You still don’t have an appropriate compiler? Locate ARM® compiler that suits you best on our website:

http://www.mikroe.com/arm/compilers/

Choose between mikroC®, mikroBasic™ and mikroPascal™ and download fully functional demo version, so you can begin building your ARM® Cortex™-M3 and Cortex™-M4 applications.

2. Projects
Once you have chosen your compiler, and since you already got the board, you are ready to start writing your first projects. We have equipped our compilers with dozens of examples that demonstrate the use of each and every feature of the EasyMx PRO™ v7 for STM32 board, and all of our accessory boards as well. This makes an excellent starting point for your future projects. Just load the example, read well commented code, and see how it works on hardware. Browse through the compiler Examples on this link:

http://www.mikroe.com/easymx-pro/stm32/

3. Community
If you want to find answers to your questions on many interesting topics we invite you to visit our forum at http://www.mikroe.com/forum and browse through more than 150 thousand posts. You are likely to find just the right information for you. On the other hand, if you want to download free projects and libraries, or share your own code, please visit the Libstock website. With user profiles, you can get to know other programmers, and subscribe to receive notifications on their code.

http://www.libstock.com/

4. Support
We all know how important it is that we can rely on someone in moments when we are stuck with our projects, facing a deadline, or when we just want to ask a simple, basic question, that’s pulling us back for a while. We do understand how important this is to people and therefore our Support Department is one of the pillars upon which our company is based. MikroElektronika offers Free Tech Support to the end of product lifetime, so if something goes wrong, we are ready and willing to help!

http://www.mikroe.com/support/
